- The Expense tracker as the name indicates allows you to track expenses. The entry point of the application is an authentication screen that will prompt you to enter your login information or go through a registration process. You should receive a registration completed successfully message if you are able to register. On authentication failure you should get an error stating invalid Login.
- Once you are done with the authentication is completed you land a page where you can choose any of the following actions
- Add an Expense
- Delete a particular Expense
- Delete all expenses
- Clear all fields
- Convert an expense to a sentence
- View details of an expense
- Edit a selected Expense
- Fields available for each expense include
- Date of the expense
- Description of the expense
- Amount of the expense
- Mode of payment
- To edit any fields double click on the field and it should allow you to make any changes needed.
- To add a new expense select the add button and add all the required fields needed for that expense and save
- Application also allows you to export expenses to an encrypted csv file
- On github you will see an image of a safe. This image represents the money taking out to use the expense.
- Then you got the login.py. This shows the login labels and of the expense tracker, and the names of each one. Whether it's removing, or adding an expense.This will also include the sizes of the labels, and, and the color of the labels.
- You then have the dummyFile where it shows a chart of each expense. This chart includes gas, food, school fees, snacks, and bills.
- The Register.txt code includes people adding or removing their expenses. This code shows the Newguy1, newguy2, and newguy3
